ANSWER 4 OF 5 HCAPLUS COPYRIGHT 2004 ACS on STN

High-level, all-electron, d. functional calcns. have been used, in  
conjunction with high-resoln. x-ray structural data, to predict, and to  
compare with expt., the contribution of unpaired electrons to the  
relaxation times for <sup>15</sup>N nuclei in oxidized *Clostridium pasteurianum*  
rubredoxin. Published x-ray structures for the iron(III) rubredoxin from  
*C. pasteurianum* were employed to construct a 104-atom model for the iron  
center that included all atoms shown to have strong electronic  
interactions with the unpaired iron electrons. The remainder of the amide  
nitrogen resonances in the protein, which show no apparent Fermi contact  
contribution to the chem. shift, are represented in the model by ghost  
atoms (atoms with no charge or basis functions). This model served as a  
starting point for quantum mech. calcns. at the B3LYP/6-311G\*\* level,  
which, in turn, yielded calcd. values for eigenvalues of the  
spin-differential field gradient tensor, which finally yielded expectation  
values for effective distances between nuclei and the delocalized spin-d.  
We report here that using effective distances, which are calcd. from the  
spin-differential field gradient tensor, in the Solomon-Bloembergen  
equation in place of distances measured from the crystal structures  
greatly improves the correlation for a plot of exptl. relaxation rates vs.  
r<sup>-6</sup> for <sup>15</sup>N resonances in *C. pasteurianum* iron(III) rubredoxin. With

increases in the speed of computers and algorithms, iterative quantum chem. optimization of paramagnetic center geometries based on NMR-derived distance and angular constraints from paramagnetic interactions should lead to significant improvements in the detn. of the structures of paramagnetic centers in proteins by NMR spectroscopy.

ANSWER 5 OF 5 MEDLINE on STN DUPLICATE 2  
Mutants of Acinetobacter calcoaceticus ADP1 unable to grow on dodecane, but retaining the ability to grow on lauric acid were isolated after ethylmethanesulphonate (EMS) treatment. This growth deficiency was complemented by a clone from a gene library constructed from chromosomal DNA of the wild-type strain. The complementing DNA mapped in a gene encoding a polypeptide with homology to rubredoxins. The deduced putative rubredoxin amino acid sequence is more similar to related proteins from Gram-positive bacteria than to the Pseudomonas oleovorans rubredoxin involved in alkane oxidation. An adjacent gene encodes a protein with similarity to rubredoxin reductase from Pseudomonas oleovorans and related NAD(P)-dependent reductases. Disruption of the rubredoxin-encoding gene by insertion of a KmR/lacZ cassette rendered the resulting strain unable to grow on dodecane or hexadecane. This demonstrates that these genes are necessary for alkane degradation. Transcriptional \*\*\*fusion\*\*\* of lacZ to the \*\*\*rubredoxin\*\*\* -encoding gene led to low level constitutive beta-galactosidase expression, whereas the fusion oriented in the opposite direction was not expressed.

<b>(54) Title:</b> RUBREDOXIN FUSION PROTEINS, PROTEIN EXPRESSION SYSTEM AND METHODS		
<b>(57) Abstract</b>  A recombination fusion protein is presented which comprises rubredoxin as the fusion partner. The fusion protein optionally includes an intervening spacer region between the rubredoxin constituent and the fused polypeptide of interest that can contain a proteolytic cleavage site for release of the polypeptide of interest. The fusion protein can contain one or more sites for affinity purification. The invention also includes methods and materials for making and using the rubredoxin fusion protein. Also provided are antigenic compounds and compositions, including vaccines, comprising a rubredoxin as a carrier molecule linked to an antigen or hapten.
